

FEATURES

- Measures geometry and mechanical vibration of the transducer
- Visualizes the vibration behavior
- Shows contribution to sound pressure output
- Predicts directivity pattern
- Separates radial and circular modes
- Analyzes actively radiating cone regions
- Detects loudspeaker defects

The Scanning Vibrometer (SCN) performs a non-contact measurement of the mechanical vibration and the geometry data of cones, diaphragms, panels and enclosures. One rotational and two linear actuators (ϕ , r , z) move a laser displacement sensor over a user-defined grid. At each measurement point the transducer is excited by a stimulus giving sufficient spectral resolution and high SNR in the measured response over the whole audio band (< 25 kHz). The collected data can be analyzed within the SCN software or exported to other FEA/BEA applications for further processing. Modern techniques of image processing are used for enhancing relevant information, suppressing noise and animating the vibration as a stroboscopic video. The sound pressure output in the far field and the directivity pattern are calculated and the contribution of each vibrating point on the vibrating surface is visualized. The software indicates critical vibration pattern and uses decomposition techniques for separating radial and circular modes.

| | | |
|-----------------------------------|---|--|
| <p>3D Scanner</p> |  <p>Mechanical scanning system with one rotational (ϕ) and two linear actuators (r, z).</p> | <p>Most electro-acoustical transducers use a single motor which excites the diaphragm, cone or panel in one direction (z dimension). Thus the measurement of the displacement in this direction can be accomplished by using a displacement sensor scanning 2 dimensions (radius r and angle ϕ) of the target surface. The transducer under test is rotated by a turn table (ϕ coordinate) and shifted by a linear actuator (r coordinate). An additional actuator is required to adjust the laser to the optimal distance V_d in the z dimension.</p> |
| <p>Motor Control</p> |  | <p>The Motor Control is the hardware control unit for the 3D Scanner. Connecting a computer via USB-interface the Scanning and Visualization Software (SCN) can be used to control the unit and gather measuring results for the following visualization. The integrated microprocessor provides state information of the Scanning Hardware for the software and controls the 3 built in stepper motor drivers for actuating each agitation axis.</p> |
| <p>Displacement Sensor</p> |  <p>Displacement sensor based on the triangulation principle</p> | <p>Optical measurement of loudspeaker cone vibration (scanning vibrometry) can also be accomplished by using Laser triangulation technique which is a cost effective alternative to Doppler interferometry.</p> <p>Since triangulation sensors provide primarily displacement, advanced signal processing is required to measure the break-up modes up to 25 kHz at sufficient signal to noise ratio.</p> <p>The voice coil displacement decreases with 12 dB per octave above resonance frequency where the mass is dominant. Thus a sinusoidal sweep with constant voltage generates $x_{peak}(f_s) = 1\text{mm}$ at the resonance frequency $f_s = 20\text{ Hz}$ but would produce only 10^{-6} mm (1nm) peak displacement at 20 kHz.</p> |

| | | |
|--|---|--|
| <p>Shaping of the Stimulus</p> |  <p>Shaped logarithmic sinusoidal sweep</p> <p>Averaged displacement signal</p> | <p>The decay of the displacement above resonance frequency can be compensated by using a stimulus where the higher frequency components are emphasized inversely. The amplitude is not constant but rises quadratically with frequency from 0.1 mV up to 10 V rms.</p> <p>Repeating the measurements with the same stimulus 2^n times and averaging the measured displacement responses will improve the signal to noise ratio by $3 \cdot n$ dB.</p> <p>Due to the shaping of the stimulus the displacement at the resonance (about 100 Hz) is in the same order of magnitude (about $0.5 \mu\text{m}$) as at high frequencies. The noise floor stays at 5nm giving sufficient signal to noise ratio (> 40 dB)</p> |
| <p>Displacement Transfer Function</p> |  <p>Transfer function $H_x(s)$ measured at the dust cap and at the surround</p> | <p>Due to the shaping of the stimulus the output signal of the triangulation laser corresponds with the acceleration of the target point. Since the shaping is not relevant for further analysis it is more convenient to calculate the transfer function $H_x(s,r)=X(s)/U(s)$ by referring the displacement $X(s)$ to the voltage $U(s)$ of the stimulus ($0\text{dB}=1\text{mm/V}$).</p> |
| <p>Grid and scanning path</p> |  <p>The scanning starts at the outside rim and proceeds inwards.</p> | <p>The target is scanned in polar coordinates (r, φ) due to the turntable and the radial actuator used.</p> <p>The grid can be generated automatically or manually to provide sufficient resolution at areas of particular interest.</p> <p>The scanning process can be performed in sequential steps</p> <ol style="list-style-type: none"> a) profile scan at constant angle φ (50 points) b) explore scan (450 Points) c) detailed scan (3200 Points) |
| <p>Scanning Modes</p> | <p>The height of the laser sensor is automatically adjusted during the scanning process according to the following modes</p> <ul style="list-style-type: none"> • Normal Scan In this mode the optimal height of the laser head is calculated from the geometry of the target object identified during the scan- | |

| | |
|------------------------------------|---|
| | <p>ning process. In this mode the laser follows the slope of the cone profile and makes it possible to measure a dust cap which is at a much lower position than the surround. This mode assumes that the cone angle is lower than 60 degree and there are no steps larger than 20 mm. This mode works for most transducers and is recommended for woofer systems.</p> <ul style="list-style-type: none"> • Flat Scan In this mode the vertical position of the laser head is not changed during the scanning. This mode gives the highest accuracy in measured geometry. It is recommended for tweeters, micro-speakers, panels where the geometry varies less than 10 mm. • Floating Scan In this mode the vertical position of the laser will always stay above a minimal value. This mode is required to measure the vibrations of transducers operated in a vacuum chamber where a glass plate is placed between target and laser head. <p>Furthermore, the specification of certain dangerous scanning radii can be used to locate critical spots on the cone for the normal and floating scanning mode. At these dangerous radii the vertical position of the laser will only be adjusted to absolutely safe values.</p> |
| <p>Geometry Measurement</p> | <p>A particular scanning mode is provided for measuring the geometry only. Hereby no excitation of the transducer is required and the total measurement time can be significantly reduced.</p> <div data-bbox="523 1151 1102 1319" data-label="Image"> </div> |
| <p>Configuration</p> | <p>The SCN Vibrometer comprises the following components:</p> <ul style="list-style-type: none"> • 3D Scanner (3 actuators move the displacement sensor in polar coordinates) • Scanning Control Hardware • Scanning Control Software • Cables <p>Other modules of the KLIPPEL R&D SYSTEM</p> <ul style="list-style-type: none"> • Laser-Displacement Sensor (see A2 Laser Displacement Sensor) • Distortion Analyzer DA2 • TRF Transfer Function Module <p>Additional equipment:</p> <ul style="list-style-type: none"> • Power Amplifier |

3 SCN Analysis Software

The SCN Analysis Software is optimized for the visualization of the vibration data of loudspeaker cones.

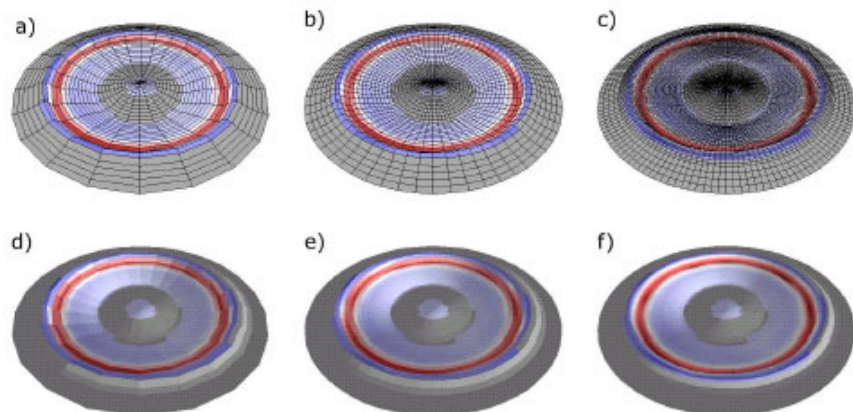

This software only requires the results (data file) of the SCN Vibrometer. The software is free for the visualization of digitally signed scan data by Klippel, for other data files a license is required.

Data Processing

The measured vibration and geometry data is prepared for an optimal visualization:

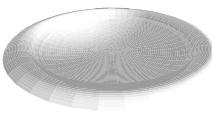

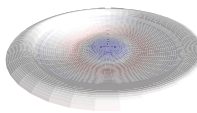

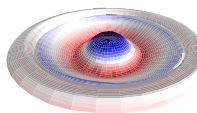

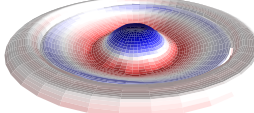

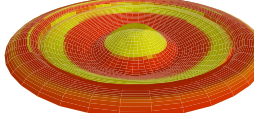

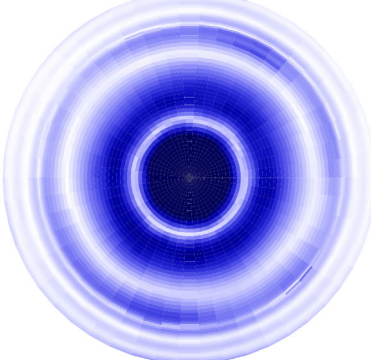

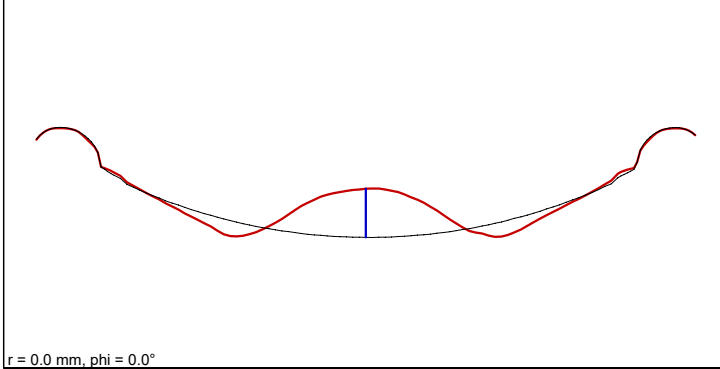

INTERPOLATION:

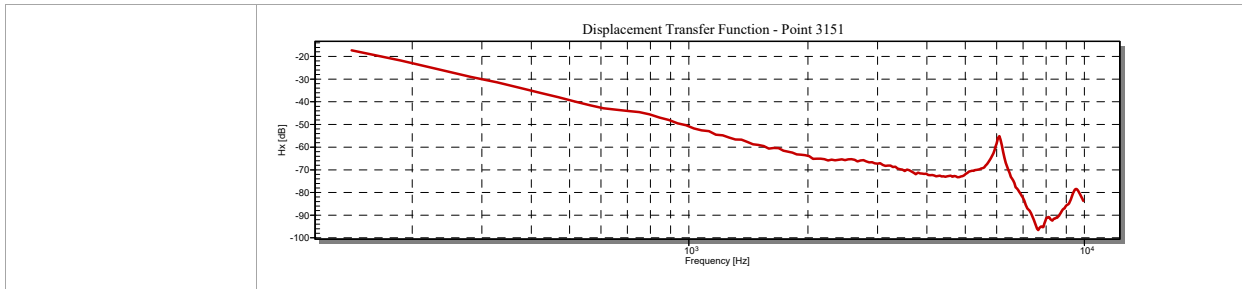

The optical resolution can be increased by interpolating between the measured points.

a) original data (744 points), b) interpolated data (2000 points) c) interpolated points (10000 points), d-f) Shaded versions of the pictures above

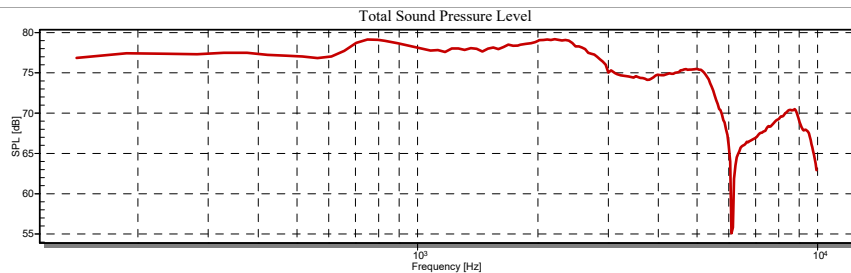

| | |
|----------------------------|--|
| | <p>SMOOTHING:</p> <p>Noise in the vibration data can be suppressed by applying two-dimensional smoothing:</p> <div data-bbox="443 358 1385 577"> </div> <p>a) original vibration, b) medium smoothing c) maximal smoothing</p> <p>ERROR CORRECTION:</p> <p>Measurement errors can be detected and removed by a correlation technique.</p> <div data-bbox="459 929 1417 1518"> </div> <p>a) original vibration data, b) applying the error correction c) applying smoothing d) increased visual resolution</p> |
| <p>3D Animation</p> | <p>From the measured geometry a three-dimensional representation of the cone is created and the vibration at each measurement point is illustrated as an offset superposing the pure cone geometry.</p> <p>By rotating the vibration phase around the unit circle at each measurement point a continuous animation of the cone motion is created. The amplitude of the superposing offset can be manually increased to visually emphasize small vibrations.</p> |

| | | | |
|--|--|--|---|
| |  <p>geometry only</p> |  <p>geometry with low vibration</p> |  <p>enhanced vibration</p> |
| <p>Coloration Schemes</p> | <p>The color of the three-dimensional cone surface can be used to display different vibration properties. It is possible to choose coloration according to the instantaneous amplitude or according to the instantaneous phase of the vibrating points. Monochrome representations can also be selected for easier printing.</p> | | |
| |  <p>Blue and red colors represent positive and negative displacement (phase), respectively, color intensity represents relative displacement (amplitude)</p> |  <p>Yellow and red colors represent positive and negative displacement (phase only)</p> | |
| <p>2D plots</p> | <p>A 2D plot is provided where the vibration data are projected on the measured geometry. A cursor may be used to locate critical vibration modes and to measure the distances between nodes in mm.</p> | | |
| |  <p>The vibration amplitude is represented as blue color intensity revealing areas of minimal and maximal vibration (nodes).</p> |  <p>The phase of the vibration is represented as yellow and red colors</p> | |
| <p>Vibration of the Cone Profile</p> | <p>A two-dimensional plot shows the profile of the measured target surface for any angle ($0 < \varphi < 360^\circ$) in mm and the overlaid vibration pattern. Modes of vibration and the position of nodes can be determined more easily.</p> | | |
| |  <p><small>r = 0.0 mm, phi = 0.0°</small></p> | | |
| <p>Vibration of one point on the cone</p> | <p>A cursor (blue bar) in the Cone Profile may be used to select a point of the cone and to show the measured displacement transfer function Hx in mm per Volt.</p> | | |

3.1 Sound Radiation

Frequency Response

Using the geometry and the vibration data the SPL response is predicted in the far-field at the point $r(r_0, \phi, \theta)$ on the basis of the Rayleigh equation.

Directivity Pattern

The sound pressure modeling can also be used to evaluate the directivity of the sound radiation.

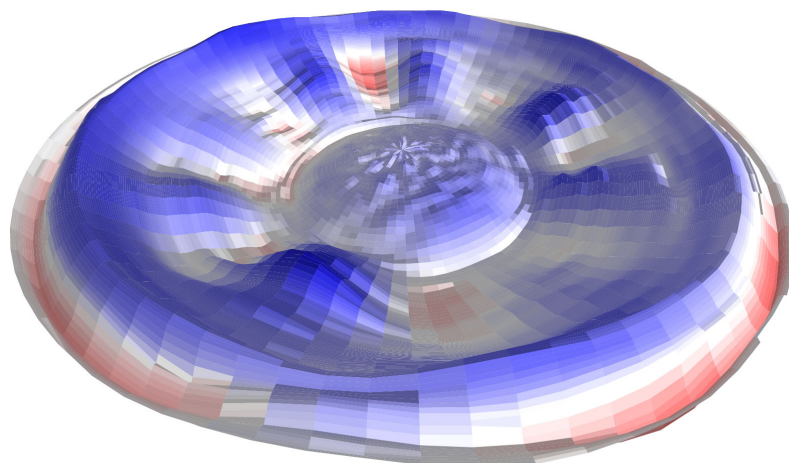

8000Hz

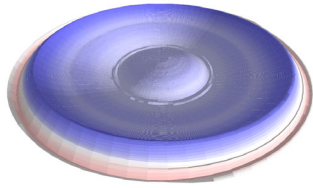

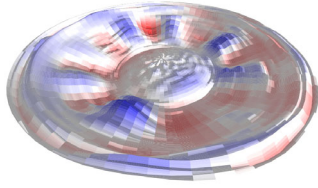

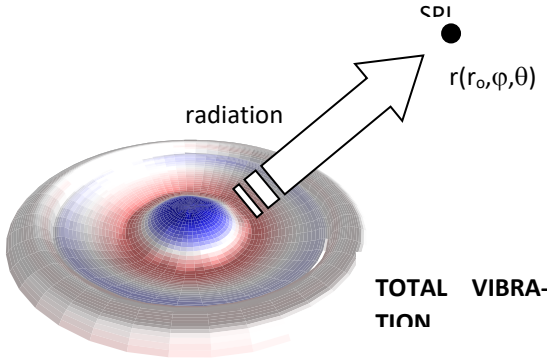

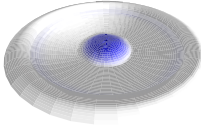

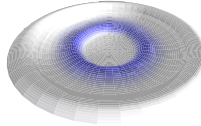

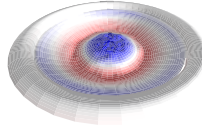

For a certain selected frequency, the total sound pressure at certain points on a hemisphere over the cone is determined and displayed in a polar plot.

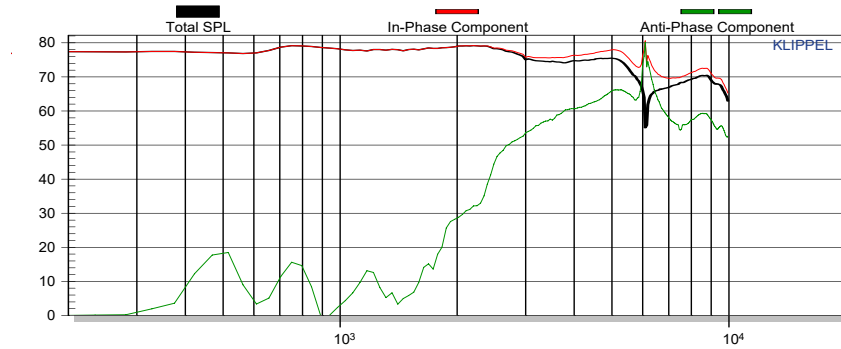

3.2 Analysis and Decomposition

Radial and circular modes

| | |
|--|--|
| | <p style="text-align: center;">Total component</p> <p>The cone vibration can be separated into single components with special relevance for the analysis by novel data decomposition techniques. The total vibration is divided into a radial component and a circumferential component. Each of them can be analyzed separately. The sound pressure produced by the respective component can be regarded independently, too.</p> $\bar{x}_{total} = \bar{x}_{rad} + \bar{x}_{circ}$ <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>Radial component</p> </div> <div style="text-align: center;">  <p>Circular component</p> </div> </div> |
| <p>Decomposition related to the sound pressure output</p> | <div style="text-align: center;">  </div> <p>A second decomposition technique is capable of separating vibration components according to their contribution to the total sound pressure at a certain listener position $r(r_o, \varphi, \theta)$.</p> $\bar{x}_{total} = \bar{x}_{in} + \bar{x}_{anti} + \bar{x}_{out-of}$ <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>In-phase Component</p> </div> <div style="text-align: center;">  <p>Anti-Phase Component</p> </div> <div style="text-align: center;">  <p>Quadrature Component</p> </div> </div> <p>The in-phase component of the vibration contributes to the sound pressure at the listening point. The anti-phase component of the vibration reduces the sound pressure output. The quadrature component produces positive and negative volume velocity which cancels out in the near field and will not contribute to the total sound pressure at the listening position.</p> |

The SPL frequency response of the total output can be compared with the in-phase and anti-phase component.

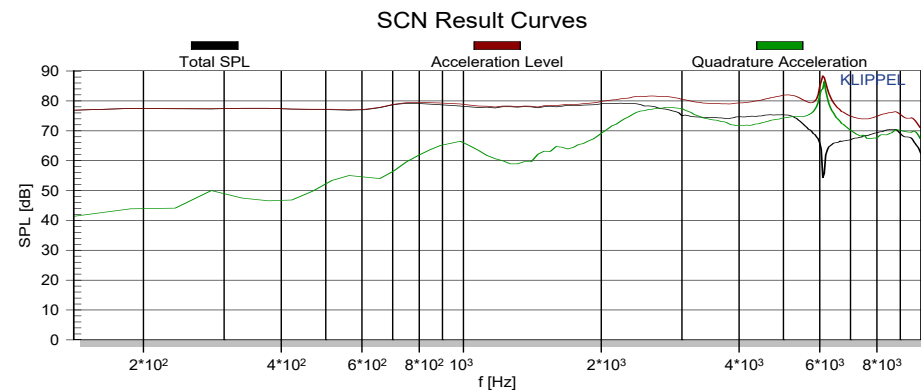

The dashed anti-phase component in the diagram above produces a very low SPL output before the cone breaks up (< 2 kHz). At 6 kHz the anti-phase component almost equals the in-phase component causing a dip in the total SPL output at the listener position.

Acceleration Level

Looking at the accumulated acceleration level of the cone surface motion is a good indication for the Eigen frequencies (Natural Frequencies) and the mechanical damping of the cone's Eigen modes (Natural Modes). The total acceleration level is shown in relation to the total sound pressure level to allow a quick comparison of true cone vibration and the actual sound radiation.

The acceleration level can be combined with the decomposition technique to investigate i.e. the vibration level of the quadrature component, which does not produce sound but still comprises a certain amount of vibration energy.

The in-phase and anti-phase components are always equal in acceleration level and sound pressure level.

3.3 Data Import and Export

| | |
|-----------------------------|--|
| Scan Data | All results from the scanning process (Vibration Data, Cone Geometry, status information) are stored in KLIPPEL SCN Format and are the basis for performing an SCN Analysis. |
| All Curves to dB-Lab | Export of all result curves of the SPL modeling and the acceleration level into a Klippel Database file which can be opened using the Klippel dB-Lab. |
| Single Curve | Export of vibration amplitude and modeled sound pressure curves in a text |

| | |
|---|---|
| | based format which can be easily imported into SCILAB / MATLAB and the dB LAB software by KLIPPEL by using the clipboard. |
| Pictures and Movies | All graphical objects can be exported as single pictures (bmp, jpg, png, vector graphics) or in case of an animation as a movie file. Thereby a compressed video stream is created and saved in the AVI video format which can be watched using any common movie player software. |
| Export and Import of Geometry and Vibration Data | The geometry of the scanned surface (in polar or cartesian Coordinates) and the vibration data (transfer function between terminal voltage and displacement at point r) can be exported and imported by using the module SCN Import/Export Interface. |

4 SCN Import / Export Interface

| | |
|---|--|
| High precision Geometry Scanning | <p>The module Import/Export Interface is an optional Add-On for the SCN Analysis Software. It provides access to the geometry of a 3D object scanned from one side at high precision. This data is very useful for loudspeaker development and quality control. Here some examples:</p> <ol style="list-style-type: none"> 1. Measuring the shape of loudspeaker parts (cones, horn geometries) where no specification is available 2. Checking the geometry of a prototype in R&D and production samples in Quality Control 3. Providing input for BEA and analyzing output from FEA |
| Geometry Export | <p>Export of the measured geometry in high precision.</p> <p>Three different DXF (Drawing Exchange Format) export options are supported:</p> <ol style="list-style-type: none"> 1. 3D Faces: All points are connected to a mesh to reproduce the surface of the measured cone. 2. Lines: The surface of the cone is given by single lines connecting the measured points 3. Points: Only the measured points are included in the DXF export <p>There is also the option of exporting the geometry in STL (stereo lithography) format.</p> |
| Geometry and Vibration Export | <p>Geometry and vibration data can be exported into text file in ASCII format. The data may be used for enhanced sound radiation modeling (BEA) and any other kinds of post processing. The geometry may be provided in Polar Coordinates (angle ϕ, radius r, height z) or in Cartesian Coordinates (x,y,z). The vibration data is provided as a transfer functions $H_x(f)=X(f)/U(f)$ between voltage $U(f)$ in Volt at the terminals and displacement $X(f)$ in mm at each measured point. The transfer function consists of an amplitude response (0dB = 1mm /V) and the phase response (rad).</p> <p>These are the following options:</p> <ol style="list-style-type: none"> 1. Export of the Raw Data: The original data is provided without applying any kind of correction. 2. Export of the Interpolated Data: The SCN Analysis Software is used to |

interpolate missing data points, for smoothing the data and for applying error correction if an optical error is identified.

5 SCN Radiation Area SD

Effective Radiation Area SD

The application Radiation Area SD is an optional add-on for the SCN Analysis Software. It provides an accurate result for the effective radiation area, particularly for small drivers and asymmetric driver shapes.

This application needs a separate license and requires only the results (data file) of the SCN Vibrometer.

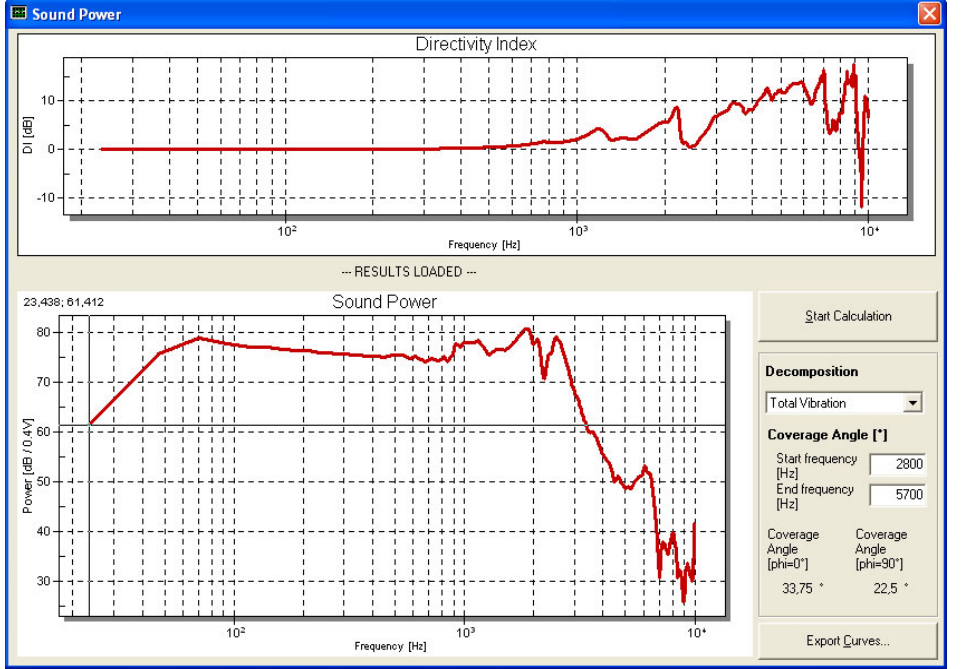

A scanning measurement with an appropriate number of measurement points on the diaphragm delivers the needed data. By dividing the total volume flow with a representative voice coil displacement a frequency dependent SD-graph is obtained. That curve will be averaged over frequency. With an adjustable averaging frequency a very stable and significant value can be derived. The averaging radius can be adjusted as well and is illustrated on the related driver plots.

Displacement transfer function H_x

By clicking the Option buttons the graph plot can be switched between the Sd-parameter curve and the averaged displacement transfer function $H_x(f)$. The latter curve is yielded by a spatial averaging of all given displacement curves at a chosen radius. The averaged displacement curve is also used to obtain the SD(f) curve.

After a calculation the data can be exported and reviewed in the Klippel dB-Lab.

6 SCN Sound Power / Directivity

| | |
|---------------------------------|---|
| <p>Sound Power</p> |  |
| <p>Directivity Index</p> | <p>The Directivity Index DI shows the ratio of the SPL on axis to the overall SPL averaged in the half space.</p> |
| <p>Coverage Angle</p> | <p>The Coverage Angle of the driver is calculated within an adjustable frequency range according to the IEC standard 60268-5.</p> |

The Sound Power application is another optional add-on for the SCN Analysis Software. It can calculate the sound power radiation into the half space without requiring a special acoustic room.

The evaluation of the frequency dependent Sound Power is based on the Rayleigh integral. A reference voltage of 0.4V is used for the calculation which allows a direct comparison of the Sound Power Level and the SPL in 1m distance.

The Decomposition into the Sound Power contributions of radial and circular vibration components can be applied, as described above in the section SCN Analysis Software.

After a calculation the data can be exported and reviewed in the Klippel dB-Lab.

7 Typical Configurations

New purchases of SCN hardware are shipped as *SCN Multi-Scanning Workbench*, a complete hardware platform for vibration, sound pressure and magnetic field scans and directly include the hardware components of the *SCN Near Field Add-On*. Additional sensors and software modules for these scans are sold separately.

Existing SCN hardware can also be upgraded with individual purchase of the *SCN Near Field Add-On* hardware, further sensors and software.

| Mass | M | | | 70 | kg |
| Vertical steps in DUT surface ⁶ with LK-H052 | | | | 45 | mm |
| Vertical steps in DUT surface ⁶ with LK-G32 | | | | 25 | mm |
| Optical surface properties | diffuse reflective material of any color (white coating of transparent and highly reflective material is recommended) | | | | |
| Target Application | dedicated to transducers (woofer, tweeter, micro-speaker, compression driver, headphone) | | | | |

| 8.2 Scanning Hardware rev. 2.0 | | | | | |
|---|--|-----|-----|-----|---------------|
| Parameter | Symbol | Min | Typ | Max | Unit |
| Sensor | Non-contact triangulation displacement sensor | | | | |
| Laser Protection Class | Class II, eye-safe, visible CAUTION! Laser Radiation! Avoid direct or indirect (e.g., reflection) exposure of human eyes to beam. | | | | |
| Scanning Grid | Polar coordinate system (φ , r), tangential triangulation | | | | |
| Vertical laser position (corresponds with height profile which could be measured) | z | 0 | | 310 | mm |
| Free space between turn table and Z-axis-frame (corresponds with height of DUT ⁵) | z | 0 | | 340 | mm |
| Horizontal Shift (radius of circular area scanned) ⁷ | r | 0 | | 300 | mm |
| Free space between stands (corresponds with Diameter of the DUT ⁵) | d | | | 760 | mm |
| Angle of turntable | φ | 0 | | 360 | degree |
| Error in z position | Δz | | 10 | 30 | μm |

| | | | | | | |
|---|---|------------|-----|----------------------|------------------------|----|
| Error in r position | Δr | | 10 | 30 | μm | |
| Error in φ position | $\Delta\varphi$ | | 0.2 | 0.5 | degree | |
| Error in measured Geometry ($0 < z < 10 \text{ mm}$) ¹ | | | 5 | | μm | |
| Scanning Speed ² | | | 0.3 | 1 | points/s | |
| Time for profile scan (50 points) ³ | | | 10 | | min | |
| Time for explore scan (450 points) ³ | | | 1 | | h | |
| Time for detailed scan (3200 points) ³ | | | 8 | | h | |
| Time for geometry scan only (3200 points) ³ | | | 5 | | h | |
| Working distance of laser head, refer to A2 Laser Displacement Sensor | Keyence LK-G32 | d | 25 | 30 | 35 / 31.8 ⁴ | mm |
| | Keyence LK-G82 | d | 65 | 80 / 68 ⁴ | 95 / 71 ⁴ | mm |
| | Keyence LK-H052 | d | 40 | 50 | 60 | mm |
| Sensor output | ac-displacement of target, distance to target | | | | | |
| Lowest frequency displacement signal | f_{min} | 0 | | | Hz | |
| Highest frequency limit displacement signal | f_{max} | $>f_{min}$ | 10 | 25 | kHz | |
| Signal to Noise ratio ³ | SNR | | 30 | | dB | |
| Noise level in displacement output ³ | x_{noise} | | | | μm | |
| Detection of optical errors | Reliability check by correlating two measurement at different distances and calculating S/N ratio | | | | | |
| Stimulus used for excitation | Shaped logarithmical sine sweep | | | | | |
| Mechanical Protection | Independent emergency stop if the laser head has mechanical contact with target | | | | | |
| Recommended workspace width | w | 85 | | | cm | |
| Recommended workspace depth | d | 61 | 80 | | cm | |
| Recommended workspace height | h | 120 | | | cm | |

Physical dimensions

See following side and top view drawing

Mounting points for accessories

2 x M10 thread (pitch = 1.5) @ $\phi = 200$ mm

2 x M10 thread (pitch = 1.5) @ $\phi = 300$ mm

4 x 3/8" – 16 UNC thread @ $\phi = 330$ mm (Rev. ≥ 1.6)

M10 and 3/8" screws must not reach through the turntable! Could cause damages during movement of the turntable.

Max. thread length inside turntable 10 mm.

Diameter of centering hole:
 $\phi = 29.1H7$ mm (29.1 +0.05/-0 mm)

| | |
|---|--|
| Diameter of centering piece $\phi = 29.1H7 \text{ mm } (29.1 +0/-0.02 \text{ mm})$ | |
|---|--|

¹ Laser sensor is kept on fixed vertical position and the vertical scanning range is limited by the peak-to-peak value of the laser sensor. In this case the laser sensor determines the error of the measured geometry.

² only positioning of the laser sensor (without vibration measurement)

³ depends on averaging, laser settings, target surface and stimulus

⁴ for measurements above $f_{max} = 10\text{kHz}$

⁵ The DUT is placed on the turntable centered with the surface to be scanned on the upper side

⁶ A vertical step in the DUT surface above the specified maximum may cause:

- A collision of the laser sensor with the DUT if $H_1 @ \text{outer radius} < H_2 @ \text{inner radius}$ (step up)
- Unmeasured points if $H_1 @ \text{outer radius} > H_2 @ \text{inner radius}$ (step down), $H = \text{DUT height}$

⁷ Valid for LK-H022, LK-H052, LK-H082, LK-G32, for LK-G82 reduced to 295 mm

8.3 Motor Control

| Parameter | Symbol | Min | Typ. | Max | Unit |
|--|-----------|-----|------|-----|------|
| Electrical Characteristics Stepper Motor Outputs | | | | | |
| Output Voltage (peak to peak) | U_{out} | | 24 | | V |
| Output Current (max) | I_{out} | | | 2 | A |
| Output Current (adjusted for R- & Z-axis) | I_{out} | | 0.9 | | A |
| Output Current (adjusted for Phi-axis) | I_{out} | | 0.5 | | A |
| Recommended Operating Conditions | | | | | |
| Power supply voltage | V_{AC} | 100 | | 240 | V |
| Power AC-frequency | f_{AC} | 47 | | 63 | Hz |
| Operating ambient temperature | T_A | 0 | 25 | 50 | °C |
| Input power | P | | 10 | 20 | W |
| Primary power supply connection with protective earth conductor is required! | | | | | |
| Power supply connection with removed earth contact could cause high voltages at the enclosure of the device. | | | | | |

8.4 Setup Parameter of Scanner

| Parameter | Symbol | Min | Typ | Max | Unit |
|------------------------|------------|------|-----|-----|------|
| Scanning Grid | | | | | |
| Increments of radius r | r_{Step} | 0.02 | 1 | | mm |

| | | | | | |
|--------------------------------|--|----------------------|-------|--------------------|--------|
| Minimal radius | r_{\min} | 0 | | | mm |
| Maximal radius | r_{\max} | | | 300 | mm |
| Increments in angle φ | $D\varphi$ | 0.03 | 4.5 | 360 | ° |
| Manual grid control | <ul style="list-style-type: none"> Remove/add single radii Indicate critical radii (activate diving scanning mode) | | | | |
| Vertical control mode | <ul style="list-style-type: none"> Variable (normal) Fixed (good for scanning of flat DUTs) Minimal distance $z > z_{\min}$ (good for vacuum measurements) Mark additional dangerous radii for safe scanning | | | | |
| Scanning Mode | <ul style="list-style-type: none"> Vibration + Geometry Geometry only | | | | |
| Generator / Signal Acquisition | | | | | |
| Minimal Frequency | f_{start} | 0 | | $< f_{\text{end}}$ | Hz |
| Maximal Frequency | f_{end} | $> f_{\text{start}}$ | 10 | 25 | kHz |
| Frequency Resolution | Δf | | 23.44 | | Hz |
| Stimulus Shaping | S | 0 | 9 | 12 | dB/oct |
| Maximal Voltage | U_{\max} | 0 | 10 | 100 | V |
| Averaging | N | 1 | 64 | 256 | |

8.5 Vibration and Radiation Analysis (Results)

| Parameter | Comments | Unit |
|--|--|------------------------------------|
| Amplitude displacement transfer function | $H_x(f)$ for any cone point $c(z, \varphi, r)$ for <ul style="list-style-type: none"> Circular and radial vibration mode In-phase component Anti-phase component Quadrature component | dB (1 mm/V = 0dB) |
| 3D Vibration Animation (Cone Surface) | Enhanced cone vibration at frequency f is superimposed with measured geometry Vibration can be decomposed in <ul style="list-style-type: none"> Circular and radial vibration mode In-phase component Anti-phase component | Geometry and vibration is relative |

9 Diagnostics

| | |
|--|--|
| <p>Visualize regular vibration modes</p> | <p>The sound pressure output of axis-symmetrical cones highly depends on the regular modes which propagate in radial direction on the cone. The radial modes can be enhanced by using the decomposition technique. The measured behavior may be compared with the results predicted by axial-symmetrical FEA to show</p> <ul style="list-style-type: none"> • limits of the piston mode • first ring resonance, surround resonance, • bending modes • membrane modes <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>Total vibration modes</p> </div> <div style="text-align: center;">  <p>Radial modes only</p> </div> </div> |
| <p>Separate Vibration and Radiation Effects</p> | <p>The Total Acceleration Level compared to the Total Sound Pressure level summarizes the effect of the surface motion on the radiated sound.</p> <div style="text-align: center;"> <p>SCN Result Curves</p>  </div> <p>The quadrature acceleration shows the vibration level which does not produce any sound at the receiver point. It comprises asymmetric motions, rocking and motion where the surface vibration phase gets orthogonal to the radiated sound.</p> <p>The frequencies and quality of the mechanical modes can be found easily from the total acceleration level.</p> |
| <p>Analyze acoustical cancellation</p> | <p>Acoustical cancellation occurs when the volume flow q of the cone area vibrating in phase with the total sound gets close to the volume flow of the area vibrating 180° phase shifted.</p> <div style="text-align: center;"> <p>SCN Result Curves</p>  </div> |

| | |
|--|--|
| | <p>If the in-phase and anti-phase components get close to each other, there will be a strong dip in the produced sound pressure at the receiver point.</p> <p>A design goal of good loudspeakers should be to always keep a certain minimal distance between both components to avoid acoustical cancellation effects.</p> |
| <p>Visualize irregular vibration behavior</p> | <p>Flexible wires and irregularities in the geometry (e.g., cone thickness) and density of the material may cause significant circular modes on the cone. These modes may be enhanced by viewing the circular modes only (Decomposition method).</p>  <p>Diaphragm of a horn compression drivers with irregular thickness</p> |
| <p>Anisotropic materials</p> | <p>Some material used for loudspeaker cones and diaphragms have anisotropic properties which produce a vibration pattern that depends on the direction. For example, the vibration of the Kevlar cone becomes maximal in the direction of the fibers.</p>  |
| <p>Localize Cause of Nonlinear Distortion</p> | <p>If cone or surround displacement is high compared to the geometry the cone behaves nonlinearly and produces nonlinear distortion of the output signal.</p> <p>Analysis: At critical excitation frequency search for regions of maximal displacement in the 3D surface animation or 2D profile animation.</p> <p>Target: Reduce the Quadrature and anti-phase vibration components which do not contribute to the SPL but generate nonlinear distortion.</p> <p>Remedy: Investigate design choices (different geometry and material) by using FEA.</p> |

| | |
|-----------------------------|---|
| |  <p>$r = 41.0 \text{ mm}, \phi = 49.5^\circ$</p> |
| <p>Rocking Modes</p> | <p>The first bending anti-resonance produces high displacement and large bending moments at the outer rim of the cone.</p> <p>Rocking modes can easily be detected by looking at the quadrature acceleration level.</p>  <p>SCN Result Curves</p> <p>Total SPL Acceleration Level Quadrature Acceleration</p> <p>SPL [dB] vs f [Hz]</p> <p>If the surface vibrates as a rigid body the quadrature component is very small. A rocking motion does not produce much radiated sound but contains substantial vibration energy. This leads to a peak in acceleration level (in the example at 470Hz and 540Hz)</p> <p>After setting the cursor to the critical frequency 470 Hz the rocking mode in the picture below may be identified.</p>  <p>$r = 20.0 \text{ mm}, \phi = 270.0^\circ$</p> <p>Diaphragm of a horn compression driver performing rocking mode and causing rub&buzz problems.</p> |

10 Evaluation

| | |
|-----------------------------------|---|
| <p>Measurement Service</p> | <p>The Vibrometer and Analysis Software may be evaluated by sending a transducer to KLIPPEL GmbH (ask for details service@klippel.de). After performing a detailed scan, the results (vibration + geometry) and the SCN Analysis Software will be provided for evaluation (animation, visualization, SPL response, directivity, decomposition). Besides a Windows PC no hardware is required.</p> |
