

MTON Multi-Tone Measurement

S64

Module of the KLIPPEL ANALYZER SYSTEM (dB-Lab Ver. 212)

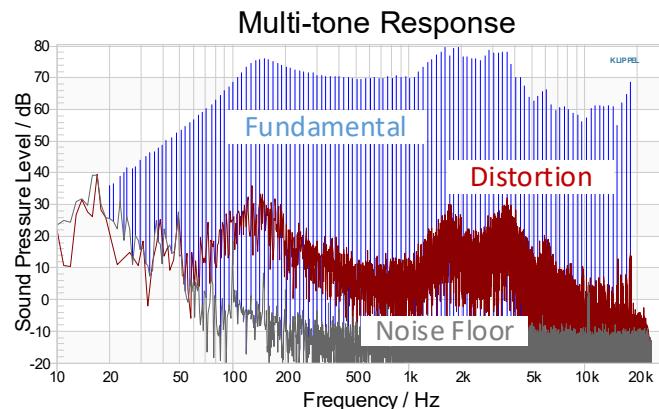

Document Revision 2.2

FEATURES

- Multi-tone fundamental and distortion measurements
- SPL Max and max. voltage according to IEC 60268-21 [1]
- Continuous Max. SPL related to ANSI/CEA-2010-B [2] and ANSI/CEA-2034 [3].
- Thermal compression
- Variable measurement and cooling time durations

BENEFITS

- Measurement of wireless, active and passive speakers
- Get acoustic "Fingerprint"
- Flexibility on stimulus and threshold setup
- Protection limits to avoid the DUT destruction
- Temperature protection

DESCRIPTION

The *MTON Multi-tone Measurement* is a Klippel RnD module which provides a complete measurement of the device under test (DUT) using a multi-tone stimulus. MTON module offers different measurement modes to provide a high flexibility of measurement procedures.

While the *Single Measurement* mode performs a single multi-tone measurement, the *Multiple Measurements* mode offers an automatic test sequence to obtain the operation limits of the DUT related to mechanical and thermal compression as well as multi-tone distortion.

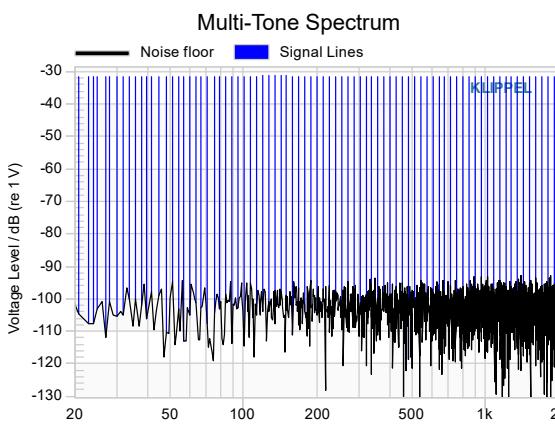

This flexibility in the threshold and stimulus configuration allows the MTON module to pinpoint the SPL_{max} according to IEC 60268-21[1] as well as the continuous max SPL (ANSI/CEA-2010-B [2] and ANSI/CEA-2034 [3]) among other standard measurements.

1 Overview

1.1 Principle

Objective	The main objective of MTON module is to provide a complete and flexible measurement environment using a multi-tone stimulus. Single values as SPL, voltage at DUT terminals and maximum displacement of voice coil, as well as result curves as multi-tone distortion, transfer function and compression are calculated.
Excitation Signal	<p>The stimulus used during the measurement is a sparse multi-tone complex spaced logarithmically on frequency. Frequency range, frequency resolution and stimulus shaping among other parameters may be specified by the user.</p> <p>The use of a sparse multi-tone complex signal to excite the system allows the separation and characterization of distortion, which can be used to define a threshold to avoid the device destruction. Moreover, the thermal compression suffered by the device under test can be calculated, since increase of temperature leads to increasing DC-resistance.</p> <p>In addition, a dense multi-tone signal similar to white noise is provided by MTON. The available shaping curves offer the stimulus characteristics required for several standards as well as pink and white noise spectrum for both sparse and dense multi-tone signals.</p> 

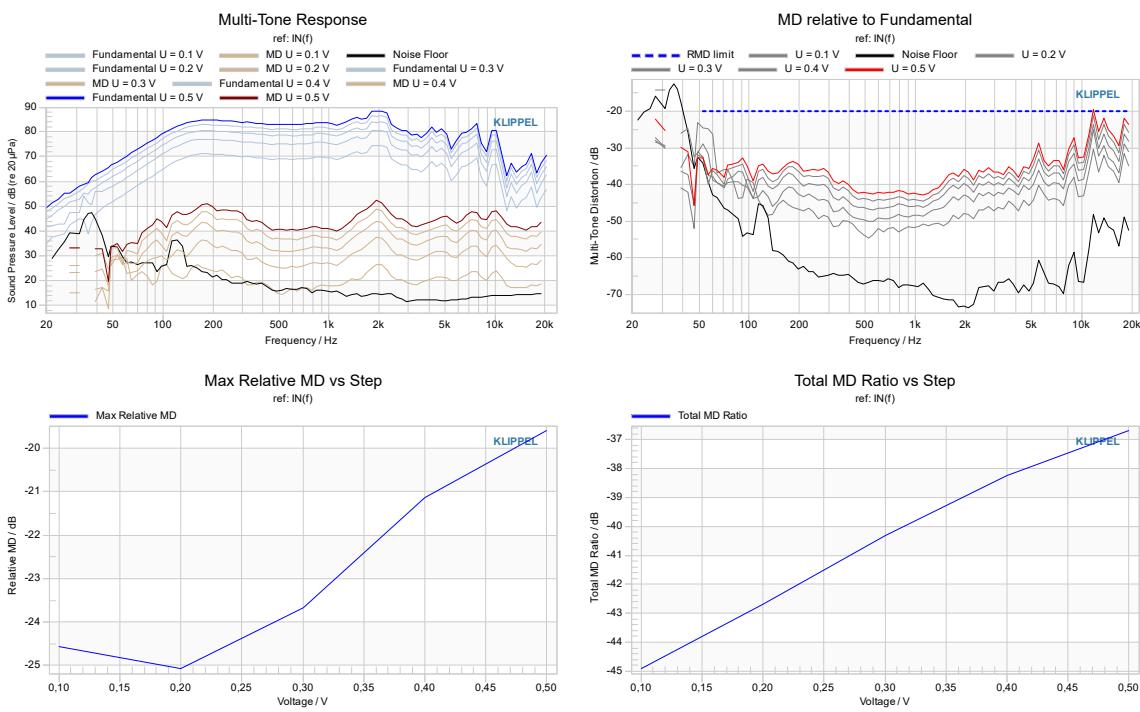

2 Examples

2.1 Compression of transfer function

The compression is calculated from the measured transfer functions using the first measurement as reference. Measurement voltage increases automatically until the user defined compression threshold (in the example 3 dB) is reached. The results of last measurement are shown in red color to emphasize the threshold overcoming.

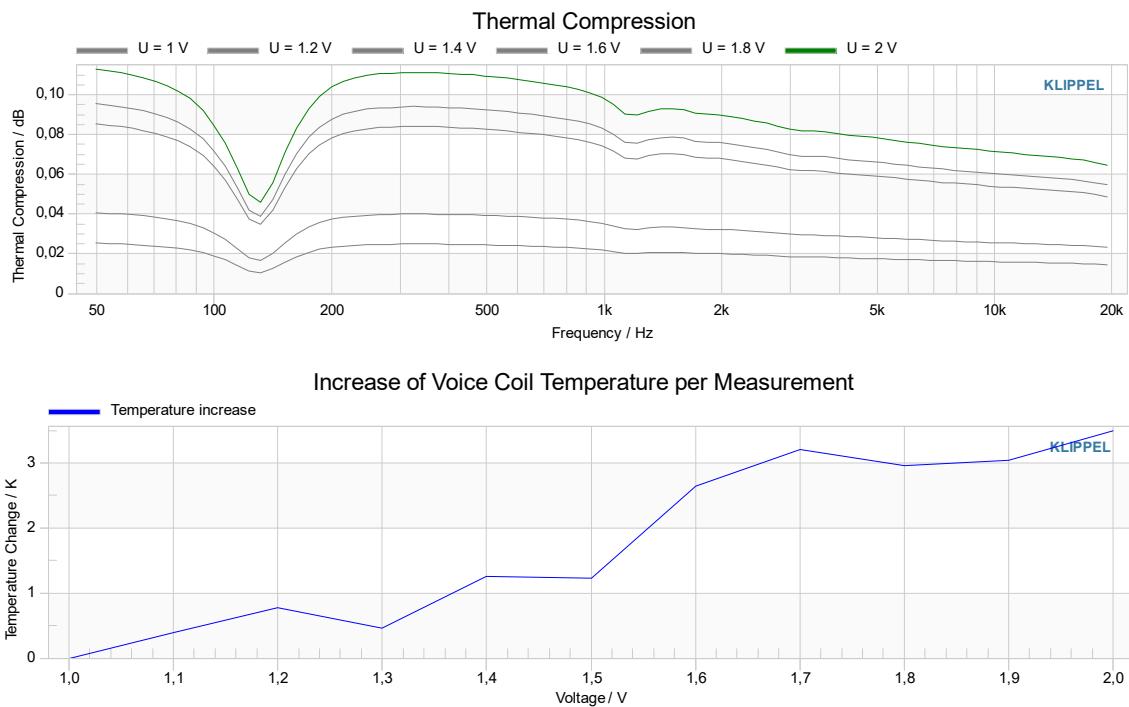

2.2 Multi-tone distortion

Multi-tone response and distortion curves as well as the total multi-tone distortion ratio are evaluated for the input signal selected by the user. Two different calculation methods can be selected to obtain the relative multi-tone distortion results:

- Band Level relative to Fundamental
- Smoothed relative to Average Level

2.3 Thermal compression / Temperature increase

Thermal compression can be measured electrically if the Klipper Analyzer (KA3, DA) is connected to the speaker terminals. This measure provides a heating threshold based on the increase of voice coil temperature.

3 Requirements

3.1 Hardware			SPEC
Analyzer		The Distortion Analyzer or the Klipper 3 are used as the hardware to perform the measurement.	H1, H3
Microphone	[optional]	Free field microphone with omnidirectional directivity characteristic over the desired measurement bandwidth.	A4
Amplifier	[optional]	KA3 Amp-Card or external audio amplifier with a flat frequency response over the desired measurement bandwidth	
Laser Displacement Sensor	[optional]	A high precision laser displacement sensor may be used to capture the membrane movement.	A2
Computer	A personal computer is required for performing the measurement.		
3.2 Software			
dB-Lab	Project Management Software of the KLIPPEL R&D SYSTEM. Requires at least version 210.820.		

4 Input

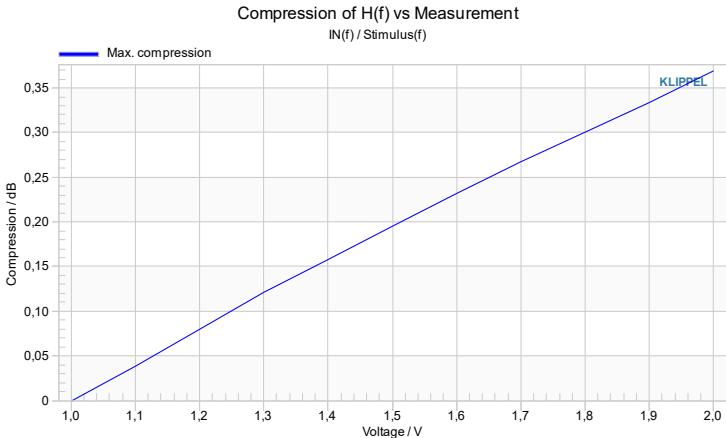

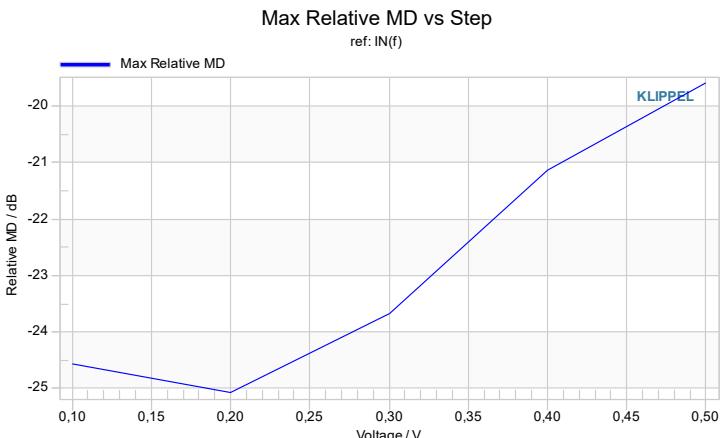

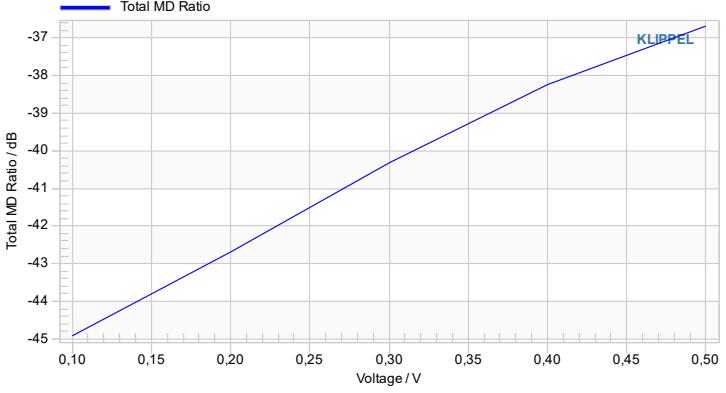

Parameter	Min	Typ	Max	Unit
Stimulus				
Min Frequency	> 0	20	F max	Hz
Max Frequency	F min	18000	0.4·f _{sample}	
Relative Resolution	1	12	999	Points per octave
Shaping	<ul style="list-style-type: none"> • 1/3 Octave Bands (R10) • Continuous Shaping Curve • Not Used 			
Time	0.02	1	5	s
Preloops	0	1		Stim. repetition
Averaging	1	1	256	Stim. repetition
Pause	0	0		s
Limits				
Max. Compression		3		dB
Max. Relative Multi-Tone Distortion		- 20 10		dB %
Max. Total Multi-Tone Distortion Ratio		-30 3		dB %

Parameter	Min	Typ	Max	Unit
Max. Increase of Voice Coil Temperature	> 0	60		K

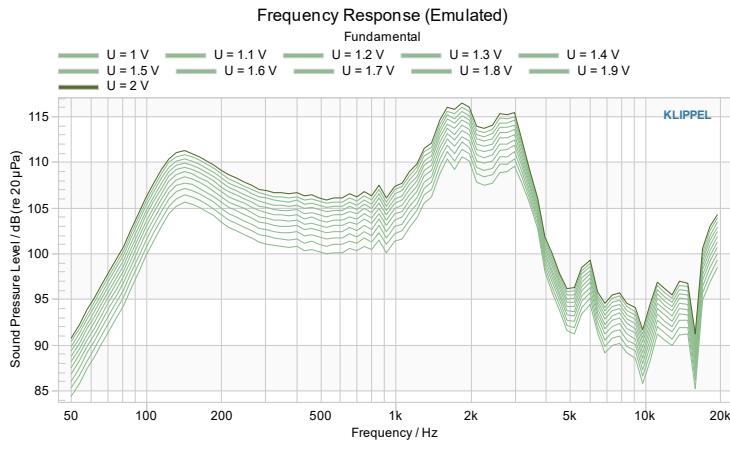

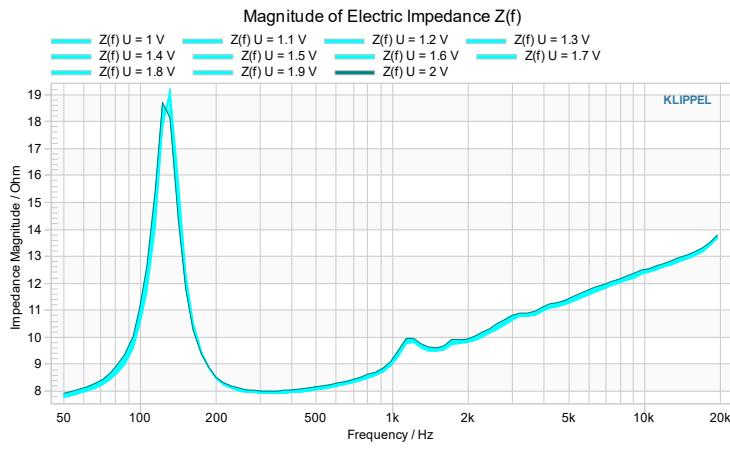

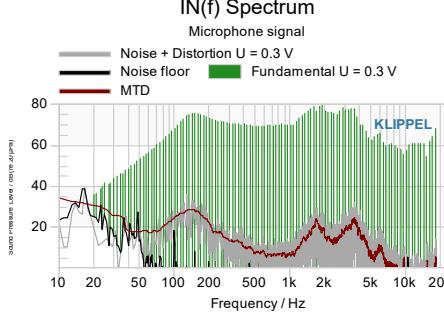

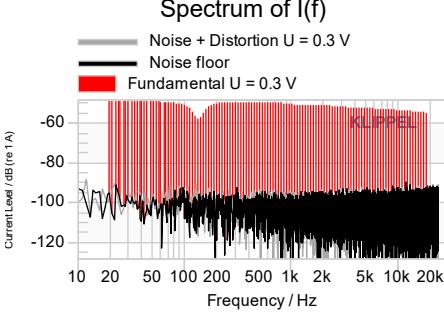

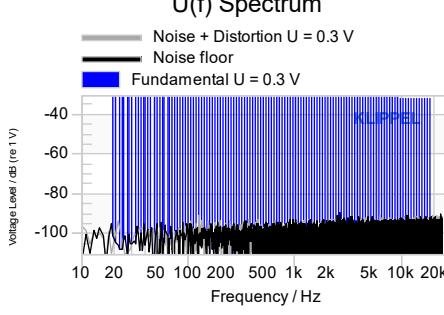

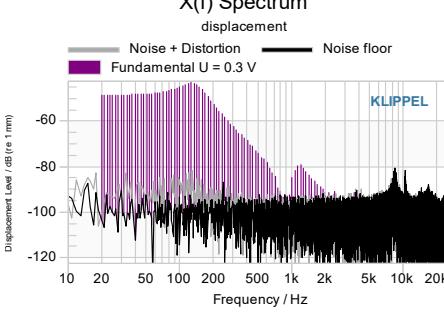

5 Output
